

# Dental Implants

Dental implants replace both your lost tooth/teeth and its roots. Replacing them will revive your smile and give an overall natural feel.

## About

Thorough examinations of your mouth, teeth and jaw are taken to determine if an implant is the right treatment for you. There must be enough strong bone in the jaw to permanently support the implant/s. Also the remaining natural teeth and supporting tissues near where the implant/s will be placed must be in good health.

## Procedure

1. A small rod which looks like a screw or cylinder is inserted into the jaw bone.
2. While the implants and the bone are bonding together and forming anchors, your doctor will place a temporary tooth.
3. A porcelain tooth is then attached to the implant.

## Cost | From \$2,500

The total cost of a single implant can be affected by several factors. Our team will advise you of these during your consultation.
